

VENTING PIPE

Safety when seconds count.

In the event of a thermal propagation, things have to move quickly. Our battery venting pipes guide any gases that arise out of the battery housing – for more safety, time and control in an emergency.

Targeted venting of gases

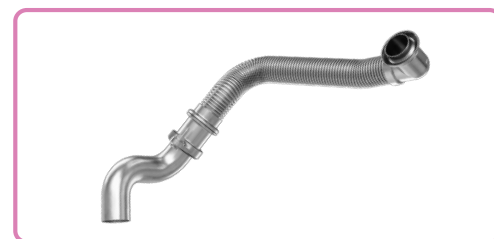

Hazardous emissions are routed from inside the battery to non-critical vehicle areas – in compliance with standards, controlled and safe.

High-temperature resistant & crash-proof

Our pipe systems can withstand temperatures in excess of 1,000 °C and remain functional even in the event of a crash thanks to flexible metal components.

Efficient design with a system

The compact, weight-optimised pipe routing saves valuable installation space and reliably cools the exhaust gases on their way out.

Trust through experience. Innovation through know-how.

From development to production: With over 10 years of development experience, more than 7 million series parts worldwide and individual solutions made of stainless steel or aluminium, we set standards – and bring safety to series production.
